

PRESS RELEASE

Nov 2006

Formerly Summit Water Chillers Australia, Matsu Chilling Systems has released a range of water chillers for air conditioning or process applications that are designed specifically for coastal and harsh environments.

Included as standard are copper / copper condensers, hot dipped galvanized steel frames, and 304 stainless steel water chiller panels, sound attenuators, and drain trays.

“To build this line of water chillers Australia’s harsh coastal environment demands involved significant research and customisation” said General Manager Daniel Rollston.

“Every aspect of this water chiller is designed to out-live our competitors by 4 or 5 times. Some of our competitors water chillers will live 2-3 years before needing replacement – we can last 10. When you look at the water chiller market today and see some manufacturers using thinner grades of aluminium for condenser fins, or not epoxy coating the fins, or using thinner grades of steel for cabinets, it just translates to shorter product life. This results in the need to replace water chillers sooner, which is not just expensive, but we believe has a greater environmental impact than just buying a product like ours that is built for durability. When you look at the total cost of water chiller ownership Matsu Chilling Systems has a very good case.”

Matsu coastal environment water chillers are designed to replace conventional air conditioning or process chillers, or to replace a number of split systems with a chilled water loop system.

Matsu Chilling Systems manufacture and distribute water chillers Australia wide for air conditioning, industrial processes, food processing, petrochemical applications, scientific uses, and process cooling machinery for all types of applications.

Matsu Chilling Systems also commission and service water chillers Australia wide.
